1 Overview

The VadaTech UTC001 is the most feature-rich MCH (MicroTCA Carrier Hub) on the market. This document is a guide to upgrading the components that make up the UTC001. These components include the MCMC, Carrier Manager, Shelf Manager, Daughter Card configuration, Services, and Tools.

1.2 Acronyms Used in this Document

Acronym	Description
MCH	MicroTCA Carrier Hub
MCMC	MicroTCA Carrier Management Controller

Table 1: Acronyms

2 MCH

The MCH package upgrades the MCMC, Carrier Manager, Shelf Manager, Services, and Tools. The package will also update the file-system. The package can be found in the file mch-x.x.x.tgz, where X.X.X.X is the version number.

The default IP address for all UTC001's is set to 192.168.1.252. The IP address is a configurable value in etc/rc.d/rc.conf, and may be changed at any time.

Note: When upgrading with the MCH package, all data will be lost. Only the files in /etc will be saved during the upgrade.

The following procedure outlines the steps to update an MCH:

1) The package must be extracted on a machine other than the target MCH due to memory constraints.

```
# tar xzvf mch-X.X.X.tgz
```

2) Once uncompressed, copy the contents of the created folder to /upgrade on the target UTC001.

```
# scp mch-X.X.X.X/* root@192.168.1.252:/upgrade
```

3) Connect to the UTCOO1 and go to /upgrade.

```
# cd /upgrade
```

Refer to the <u>VadaTech MicroTCA Shelf Manager Command Line Interface Reference Manual</u> and <u>VadaTech MicroTCA Carrier Manager Command Line Interface Reference Manual</u> for establishing a connection.

- 4) Run the upgrade command.
 - a. The user will be prompted to keep the old serial number, or enter a new one. Press <ENTER> to keep the old serial number. Otherwise, enter the new serial number and press <ENTER>.
 - b. The user will be shown the current software, management, and daughter card settings. Press <ENTER> to keep the old serial number. Otherwise, enter ${\tt n}$ to change the settings.
 - c. To continue with the upgrade, enter y.

```
# upgrade
Use serial number 1234567? (press ENTER to keep it)
Serial number:
Keeping old serial number
****CURRENT SETTINGS****
Shelf Manager : Enabled
SNMP daemon : Enabled
SNMP trap handler : Enabled
Web server : Disabled
Spread spectrum clocking mode is disabled
Do you want to keep these settings? (press ENTER to keep existing or `n')
==== VT002 Upgrader ====
REDBOOT:
ROOTFS: vt002_nand_flash_mch-X.X.X.img
KERNEL:
  FPGA:
Please ensure that you have specified the proper images.
Do you wish to continue with the upgrade (y/n)? y
```

5) Power cycle for the changes to take effect.

3 MCMC Configuration

The UTC001 comes in many different configurations. When upgrading the MCMC configuration, verify that the correct package is being used; otherwise the UTC001 may not function as expected. The configuration package can be found in the file utc001-ABC-DEF-GHJ-x.x.x.tgz, where ABC-DEF-GHJ represents the configuration options of the UTC001 and X.X.X is the version number.

The default IP address for all UTC001's is set to 192.168.1.252. The IP address is a configurable value in etc/rc.d/rc.conf, and may be changed at any time.

The following procedure outlines the steps to update an MCMC configuration:

1) Copy the configuration package to /upgrade on the target UTCOO1.

```
# utc001-ABC-DEF-GHJ-X.X.X.tgz root@192.168.1.252:/upgrade
```

2) Connect to the UTCOO1 and go to /upgrade.

```
# cd /upgrade
```

Refer to the <u>VadaTech MicroTCA Shelf Manager Command Line Interface Reference Manual</u> and <u>VadaTech MicroTCA Carrier Manager Command Line Interface Reference Manual</u> for establishing a connection.

3) Extract the files from the package.

```
# tar xzvf utc001-ABC-DEF-GHJ-X.X.X.tgz
```

4) Go to the created folder.

```
# cd utc001-ABC-DEF-GHJ-X.X.X
```

5) Run the upgrade command.

```
# upgrade
```

6) Power cycle for the changes to take effect.

4 Daughter Card Configuration

The UTC001 can be manufactured with one of several different daughter cards. When upgrading the Daughter Card configuration, verify that the correct package is being used; otherwise the UTC001 may not function as expected. The configuration package can be found in the file <code>DA###-x.x.x.tgz</code>, where ### is the type of Daughter Card and X.X.X is the version number.

The default IP address for all UTC001's is set to 192.168.1.252. The IP address is a configurable value in etc/rc.d/rc.conf, and may be changed at any time.

The following procedure outlines the steps to update the Daughter Card configuration:

1) Copy the configuration package to /upgrade on the target UTC001.

```
# DA###-X.X.X.tgz root@192.168.1.252:/upgrade
```

2) Connect to the UTC001 and go to /upgrade.

```
# cd /upgrade
```

Refer to the <u>VadaTech MicroTCA Shelf Manager Command Line Interface Reference Manual</u> and <u>VadaTech MicroTCA Carrier Manager Command Line Interface Reference Manual</u> for establishing a connection.

3) Extract the files from the package.

```
# tar xzvf utc001-ABC-DEF-GHJ-X.X.X.tgz
```

4) Go to the created folder.

```
# cd utc001-ABC-DEF-GHJ-X.X.X
```

5) Run the upgrade command. The daughter card's serial number must be specified as an argument.

```
# upgrade XXXXXXX
```

Power cycle for the changes to take effect.
